The History of Difco Quality Control...

and what it means to you today

Difco was developed by producing better products through control of quality. Now there is a history of more than seventy years of dedication to accuracy and dependability, specialized equipment, exacting materials control. It's a history of a unique kind of control. Difco tests each ingredient before it is accepted for use. Testing throughout preparation assures compatibility. The finished product is then tested for dependable performance under the conditions for which the product is intended. Result? Perfectly standardized products that give reproducible results every time.

What does it mean to you?

Assured reliability. Savings in time and money. Dependable microbiological results in your laboratory.

Find out why more researchers use S&S membranes for RNA/DNA hybridization, protein binding, DNA sequencing, and DNA blotting.

It won its reputation as B6, its old name. Now its catalog number is BA 85. They’re two numbers for the same S&S nitrocellulose 0.45μm membranes. Either way, more researchers use S&S 0.45μm membranes than any other brand, in circles for adsorption of DNA strands and in sheets to blot DNA fragments from gels. As the laboratory standard, S&S is specified and preferred in most of the papers published on RNA/DNA hybridization, protein binding assays, or RNA or DNA sequencing.

If you don’t know why, it’s easy to find out. Fill in and mail the coupon to S&S, and receive a free sample of S&S BA 85—a 15cm square or circles up to 50mm diameter.
