

COVER IMAGE

*Cover photograph:* Polymorphic nature of human T-cell leukemia virus type 1 (HTLV-1) particle cores. Shown are representative authentic HTLV-1 particles that demonstrate the polymorphic nature of core morphologies and the low abundance of particles with complete cores. In the background are representative results of fluorescence *in situ* hybridization (FISH) analyses that were used to identify the chromosomal location of HTLV-1 proviruses. The low abundance of HTLV-1 particles with complete cores may help explain the low infectivity of HTLV-1 particles. (See related article in August 2017, vol. 91, no. 16, e00369-17.)
