### COVER IMAGE

*Cover photograph:* Mallard ducks (*Anas platyrhynchos*), which are found throughout North America year-round, serve as a primary natural reservoir for influenza A viruses. To better understand the mallard duck influenza A virus reservoir, we have been sampling migrating ducks in late summer on lakes in Alberta, Canada, for over 40 years. Thirteen hemagglutinin subtypes of influenza A viruses have been isolated from these ducks, and a study of the H7 subtype revealed that many of these viruses caused severe disease in a mouse model. The importance of this reservoir as a source of potentially pathogenic H7 influenza A viruses indicates the need for continued surveillance.
