COVER IMAGE

Cover photograph: The influenza A virus M2 protein normally is targeted to the apical membrane of polarized epithelial cells. Restricting M2 localization to the endoplasmic reticulum (ER) or basolateral membranes adversely affects virus replication. The image shows MDCK II cells transiently transfected with a plasmid encoding the influenza A virus M2 protein modified with an ER retention signal (green) with cells also stained with a marker for the ER (red). Nuclei are counterstained with 4',6-diamidino-2-phenylindole (DAPI; blue). (See related article at e01425-18.) (Copyright © 2018 American Society for Microbiology. All Rights Reserved.)
