

COVER IMAGE

Cover photograph: Structural intermediates in the disassembly pathway of Flock House virus (FHV), emphasizing the asymmetric, dynamic alterations in nonenveloped capsids during uncoating. FHV, which belongs to the *Nodaviridae* family, has a bipartite, positive-strand RNA genome encapsidated in a symmetric, icosahedral capsid (T=3). Shown are the wild-type form (top left), an intermediate particle which has undergone structural alterations on only one part of the capsid (middle), and a distinctive particle caught in the process of releasing its genome (bottom right), on a background consisting of a cryo-electron micrograph of frozen hydrated, disassembly intermediate particles.
