**COVER IMAGE**

*Cover photograph:* Hemagglutinin (HA) stalk-reactive antibodies (rainbow colored) bind an important class of highly conserved epitopes on influenza virus. Mechanistically, these antibodies are known to inhibit the fusion between the viral envelope and endosomal membranes. This report describes a novel mechanism of protection by HA stalk-reactive antibodies: they are also able to block access of neuraminidase (NA; green tetramers) and its enzymatic activity through steric hindrance when NA is abutted to HA (light blue trimers), thus prohibiting viral egress.
