### COVER IMAGE

*Cover photograph:* Lund human mesencephalic (LUHMES) cells that have been differentiated into postmitotic neurons and infected with herpes simplex virus 1 (HSV-1). The image shows immunofluorescent staining for  $\beta$ III-tubulin (a neuronal marker highlighting the neuron cell body and axons) in red, ICP4 (an immediate-early HSV-1 protein) in green, and DAPI staining (DNA in nuclei) in blue, 24 h after infection. The LUHMES cells support a latent HSV-1 infection and provide a scalable *in vitro* model to study acute and latent HSV-1 infection. (See related article at e02210-18.)
