COVER IMAGE

Cover photograph: HIV-1 viral membrane fusion is mediated through binding of HIV-1 envelope (Env) glycoprotein to CD4, which results in recruitment of coreceptor CCR5 or CXCR4. NF279 or NF449 can inhibit HIV-1 productive infection through inhibition of HIV-1 viral membrane fusion, shown through antagonism of the V1V2 region of HIV-1 Env (dark green dots). The P2X1 receptor is shown nearby in the membrane, and NF279 or NF449 may directly inhibit the receptor in addition to antagonism of HIV-1 Env. (See related article in March 2020, vol. 94, no. 6, e01622-19.) (Courtesy of Ni-ka Ford, Mount Sinai Health System; reprinted with permission.)

SPOTLIGHT

Articles of Significant Interest in This Issue

e00152-20

STRUCTURE AND ASSEMBLY

Phase Separation of Epstein-Barr Virus EBNA2 and Its Coactivator EBNA1 Controls Gene Expression

e01771-19
